#### **Acknowledgements:**

The Indiana Prevention Resource Center is grateful for the assistance provided by Mohammad R. Torabi, Ph.D., M.P.H., and Massoumeh Majd-Jabbari, Ph.D., statistical consultants, who assisted with survey design and conducted reliability testing of our survey instrument, and John Kennedy, Ph.D., who assisted with confidence interval and sampling error formulas. The IPRC would also like to thank former survey director Dr. E. Lisako J. McKyer for her assistance with data analyses, including the margins of error and for being available for consultation.

The Indiana Prevention Resource Center is operated by Indiana University's Department of Applied Health Science, School of Health, Physical Education and Recreation. The Institute for Drug Abuse Prevention is a unit of the office of Research and University Graduate School.

This study was funded, in part, by a contract with the Indiana Family and Social Services Administration, Division of Mental Health and Addiction, using funds from the federal Substance Abuse Prevention and Treatment (SAPT) Block Grant administered by the U.S. Department of Health and Human Services, Substance Abuse and Mental Health Administration.

#### Alcohol, Tobacco, and Other Drug Use by Indiana Children and Adolescents The Indiana Prevention Resource Center Survey - 2005

#### **Executive Summary and Highlights**

Illicit drug use among Indiana youth in 2005 – particularly the four major drugs (cigarettes, alcohol, marijuana, and inhalants) has continued to decline. Indeed, many of the rates show very strong declines of 3 or more percentage points. While the previous ATOD reports indicate a slow and steady decline since the mid-late 1990s, the 2005 data indicate that the trajectory of the decline – at least among some substances – has steepened. In sum, 2005 ATOD use rates are among the lowest seen in the state in years.

Cigarette and alcohol prevalence rates are among the more notable decreases, with declines reported for nearly all prevalence rates and among all grades except 12<sup>th</sup>. Alcohol use rates have experienced the strongest declines. Indeed, all grades (except 12<sup>th</sup>) show declines of at least 2 percentage points. Lifetime alcohol use among 7<sup>th</sup> graders shows a decrease of more than 4 percentage points, with no grades experiencing an increase in alcohol use. Marijuana use – particularly lifetime and annual use - has declined among all grades except 12<sup>th</sup>. While significant changes are not reported for 12<sup>th</sup> graders, no increases are noted. Rather, rates have stabilized.

The survey, which is in its fifteenth year, is coordinated annually by the Indiana Prevention Resource Center (IPRC) at Indiana University, and is funded by the Indiana Family and Social Services Administration, Division of Mental Health and Addiction. The 2005 results were obtained from analyses of data from 140 separate local surveys of 136,782 youth in grades six through twelve, attending 435 schools in Indiana.

Indiana prevalence rates for marijuana and most other illicit substances are still higher than the rates reported in 1991 and 1992. However, the data from the past six to seven years indicate that, in general, illicit use of most drugs by youth is experiencing a steady decline.

National data showed a steady decrease in use rates for other drugs from about 1980 through 1992, followed by sharp increases from 1993 to 1997. The data from 1998 national surveys showed a leveling of the increases, followed by a slight decrease beginning with data from 1999 through 2002. Indiana's 2005 rates for binge drinking and for marijuana use fell below 2004 national rates. The gap between state and national rates continues to widen, to the benefit of the state. National survey data for 2005 will not be available until late December.

Statewide prevention initiatives have been in place for nearly a decade and include nearly 400 after-school prevention programs. They appear to be **experiencing continued success**, **based upon the findings of the statewide survey.** 

Indiana continues to rank among the highest in terms of the quality and extensiveness of its coordinated statewide prevention efforts. The inclusion and involvement of communities in statewide initiatives and other prevention campaigns have resulted in attitudinal, behavioral and

policy changes across the state. The continued decline in youth smoking rates serves as evidence of the effectiveness of this statewide coordinated effort aimed toward Indiana youth. This year's most significant findings follow.

#### **Tobacco Use Declines**

Lifetime prevalence of cigarette smoking among Indiana youth continues to decline among all grades, with large declines (i.e., over 3 percentage points) reported among nearly all grades. This change in trajectory is good news, particularly since rates are expected to continue to decline. Cigarette smoking rates are key as they have been demonstrated to function as a "gateway drug" that increases young users likelihood of using other drugs. Indeed, smoking rates continue to serve as the best statistical predictor of other drug use among youth. In 1992, Torabi, Bailey and Majd-Jabbari found that young smokers are 10 to 50 times more likely than nonsmokers to use marijuana, cocaine, and other illicit drugs. This finding has held up since then and has been validated by several other studies. Given this relationship, changes in tobacco use should lead to changes in use of other drugs.

While cigarette smoking rates reflect the success of prevention efforts, there are signs of increased usage of *other* tobacco products. Cigar smoking among 12<sup>th</sup> graders showed a slight increase. However, counter to 2004 findings, smokeless tobacco use showed a decline among nearly all grades.

The reductions in smoking rates among Indiana youth can be attributed in part to prevention program efforts throughout the state, as well as to retailer compliance with regulations designed to prevent the sale of tobacco to minors. The latter effort is part of two parallel initiatives (the Synar Amendment and the Tobacco Retailer Inspection Program). Combined with localized primary prevention efforts, these programs have made a positive impact on cigarette prevalence rates.

According to the 2000 U.S. Census reports, approximately 605,000 Indiana youth are of ages 11 through 17 years. For 2005, this means that about **82,280 fewer Indiana children and adolescents smoke cigarettes** on a monthly or more frequent basis in 2005 than in 1996; about **56,870** fewer Hoosier youth smoke cigarettes daily; and about **41,140** fewer smoke a half pack or more per day. Using these figures, the change between 2004 and 2005 yield the following:

- 7,865 fewer Indiana youth who smoke regularly on a monthly basis
- 5,445 fewer Indiana youth who on a smoke daily
- 10,890 Indiana youth who are heavy smokers (i.e., ½ pack or more per day).

The tables below summarize the percentages per years, as well as the total changes in percentage points.

#### **Alcohol Use Rates See Steep Declines**

Monthly Cigarotta Uca

Alcohol use rates saw large declines among nearly all grades. Lifetime rates declined over 4 percentage points among 7<sup>th</sup> graders, more than 3 percentage points among 6<sup>th</sup>, 8<sup>th</sup>, and 9<sup>th</sup> graders, and more than 2 percentage points among 10<sup>th</sup> and 11<sup>th</sup> graders. The 12<sup>th</sup> graders' lifetime use of alcohol remained steady. Indiana alcohol prevalence rates fell below the national rates for the third consecutive year. Binge drinking rates declined among younger grades (6<sup>th</sup> through 9<sup>th</sup>), which is different than the trend reported in previous surveys. Prior to 2005, reductions in alcohol use were found among older grades, but not among the younger grades. The 2005 findings finally yielded changes among the younger grades. In summary, alcohol use rates among Indiana youth are finally experiencing what appears to be a steady decline. Overall, fewer youth appear to be experimenting with alcohol.

#### **Inhalants**

For 2005, inhalant use among all grades saw a decrease or a plateau. Lifetime use (i.e., "ever use") of inhalants is higher for younger grades than for older grades. Indeed, lifetime rates for 8<sup>th</sup>, 9<sup>th</sup>, and 10<sup>th</sup> grades are higher than among 11<sup>th</sup> and 12<sup>th</sup> grades. The range and accessibility of products used for "huffing" has expanded exponentially over the recent years. Inhalant use warrants watching as it may have serious and immediate health consequences (e.g., brain damage, coma, death), even for first time users. Therefore, the survey results suggest continued

vigilance in tracking inhalant rates, especially among younger grades, as well as some realignment of prevention efforts to address this issue.

#### Methamphetamine Use

In 2005, questions to assess the prevalence of methamphetamine (meth) use were added to the survey. Methamphetamine use rates among Indiana youth varied. For Indiana, 5.5% of 12<sup>th</sup> graders reported using meth at least once in their life, which is slightly lower than the national rate for this grade (6.2%). However, reported monthly use among 8<sup>th</sup>, 10<sup>th</sup> and 12<sup>th</sup> graders appear to be higher than the national rates, and warrants close continued monitoring.

	6th	7th	8th	9th	10th	11th	12th
Lifetime (Ever Use)	0.7	1.2	2.4	3.5	4.5	4.6	5.5
			(2.5)		(5.3)		(6.2)
Annual (Within past year)	0.5	0.9	1.7	2.5	3.1	3.0	3.3
			(1.5)		(3.0)		(3.4)
Monthly (Within 30 days)	0.3	0.6	1.1	1.5	1.6	1.5	1.7
			(0.6)		(1.3)		(1.4)

Note: National rates, when available, are in parentheses.

#### **Gambling Prevalence**

Questions to assess annual prevalence of gambling behaviors were included in this year's survey. The large majority of Indiana youth do not engage in gambling behaviors. Among those who did engage, most did not consider their behaviors to be problematic. However, a greater proportion of youth in younger grades tended to view their behaviors as problematic than compared to youth in older grades.

Question	Response	6th	7th	8th	9th	10th	11th	12th
Bet on games	Not at all	83.1	81.9	78.4	78.5	80.2	82.6	83.4
Bet on sports	Not at all	84.8	83.8	80.9	80.4	82.4	84.2	84.4
Felt bad about the amount bet	Yes	3.5	3.0	3.0	2.3	2.0	1.6	2.1
Would like to stop but could not	Yes	3.5	2.2	2.1	1.5	0.9	0.7	0.1

#### **Gender Differences**

Traditionally, ATOD use among males exceeded those of females. However, findings from 2005 emphasize a trend which appeared in the late 1990s and early 2000s. Females, particularly those in the middle grades (7<sup>th</sup>, 8<sup>th</sup>, and 9<sup>th</sup>), show higher use rates of some substances (especially alcohol) than males. These findings warrant closer monitoring as well as realignment of prevention efforts to be gender-specifically tailored.

#### "Cohort Effect" for Year-to-Year Comparisons

Both national and previous state surveys have encountered on occasion, a cross-section (i.e., cohort) of youth whose ATOD use rates are inconsistent with the average use rates. Furthermore, these "differences" persist across time when they are surveyed during subsequent years. Indiana experienced a "cohort effect" by youth in the class of 2002. When these youth were initially surveyed in 1996 as 6<sup>th</sup> graders, their drug use rates were lower and remained lower than those of other classes. This so-called "cohort effect" may influence our interpretation of data for adjacent classes, particularly the class that follows them.

The 6<sup>th</sup> graders from the 2003 survey (who were 7<sup>th</sup> graders in 2004) showed signs of another cohort effect. This group appeared to have higher ATOD prevalence rates for most drugs - more than other grades. In 2004, we reported signs of another cohort effect, albeit it was premature for absolute determination. This year, Indiana youth in 8<sup>th</sup> grade report decreased prevalence rates for most drugs that are consistent with the declines seen in other grades. However, monthly prevalence of cocaine, crack, and tranquilizers saw increased in this grade, whereas prevalence rates for these substances declined for other grades. These mixed findings make it difficult to definitively conclude the existence of another cohort effect. Therefore, continued close monitoring is warranted.

#### INTRODUCTION

This report describes the main findings from the fifteenth annual survey of alcohol, tobacco, and other drug use by Indiana children and adolescents coordinated by the Indiana Prevention Resource Center under a contract with the Indiana Family and Social Services Administration - Division of Mental Health and Addiction (formerly the Indiana Department of Mental Health, Division of Addiction Services). This survey provides information about the prevalence of alcohol, tobacco, and other drug (ATOD) use needed for statewide and local planning purposes. From mid-March to mid-April of 2005, data were collected by local school officials in local surveys in 435 schools in 140 different communities throughout Indiana. This yielded 136,782 usable surveys. Similar to the past 14 years, the school surveys conducted this year provided enough data from which to draw inferences about alcohol and other drug use by students in grades 6 through 12 throughout the entire state. The Indiana Prevention Resource Center (IPRC) coordinates statewide analysis of these separate data sets for its annual "Alcohol, Tobacco and Other Drug Use Survey" to provide a scientifically designed and representative sample of the statewide prevalence of ATOD use by children and adolescents in Indiana.

The survey was designed with two purposes in mind: (1) to measure ATOD prevalence on a statewide basis for statewide planning and evaluation, and (2) to measure ATOD prevalence on a local basis for local planning and evaluation purposes. Since detailed information is required by many local communities in order to qualify for federal or state funding, a very large number of schools volunteer to participate in the IPRC's survey. Although other survey instruments are available to local schools, the IPRC survey and its reports are provided to the local communities without charge. Widespread participation in the survey generates a statewide sample that is much larger than would be needed simply for statewide planning purposes, but this is necessary in order to generate meaningful community-level data. Until 2001, most schools were scheduled to participate on a biennial or triennial basis with one exception. The state's largest school district (with about 8% of the total state school population) participated annually to avoid skewing the "off-year" results. Starting in 2002, schools were offered the option of annual participation.

Year	Number of Usable Surveys	Year	Number of Usable Surveys	Year	Number of Usable Surveys
1991	23,319	1996	36,586	2001	89,861
1992	20,269	1997	72,571	2002	77,068
1993	90,586	1998	44,232	2003	141,342
1994	81,732	1999	81,685	2004	91,577
1995	63,631	2000	72,523	2005	136,782

The 1991 through 1993 surveys included fifth graders, who were eliminated in 1994. The fifth grade samples were more difficult to obtain, required working with many more elementary schools, and were much less reliable due to a disproportionate number of unusable surveys.

Since data on fifth graders were not required for statewide planning purposes, they were eliminated from future samples. As data are reported by grade, elimination of fifth graders does not influence the prevalence rates in grades 6 through 12. While identical populations were not sampled each year, the populations are comparable and were selected for geographic and community-size balance in an identical manner and, thus, should produce comparable data.

The sampling method has changed since the survey's inception. At that time, an attempt was made to assure geographic and community-size balance, with an appropriate number of schools and subjects selected from each region of the state, as well as appropriate sized rural, urban, and minority populations. The communities selected for participation and for the statewide analyses are representative of the state in terms of rural/urban and ethnic mix.

Initially, schools were selected in a three-stage purposive stratified sampling process to yield a sample that was representative of the state as a whole. A three-stage purposive/quota cluster sampling procedure was used to yield a representative sample of Indiana students that were stratified by grade and purposively selected taking into account geographic balance, ethnic diversity, and community size. Schools and communities were purposively selected to assure proportional representation from the various parts of the state, utilizing ten planning regions established by the Governor's Commission for a Drug-Free Indiana, and to assure adequate sampling of minority populations and of students from rural areas. Schools were then assigned a quota designed to yield appropriate numbers of participants in each grade.

Intact classes were randomly selected as sampling clusters. The sample represented the sociodemographic makeup of the state reasonably well, based upon the 2000 Census of Population and Housing. Previous samples (i.e., pre-2005) consisted of appropriate subsamples from each of the ten planning regions. The number of African-American respondents and Hispanic respondents appropriately represented their share of the state's population.

The changing demographics of the state warranted a re-examination of the sampling protocol; assurance was needed that the procedure continues to yield a representative sample. In 2003, sampling size was increased in an effort to improve the likelihood of inclusion for certain subpopulations (e.g., Hispanic/Latino) who have growing and increased presence in Indiana. Subsequently, the larger sample size allowed for an assessment of the comparability and validity of the original sampling method. In other words, one can determine whether the original method with a smaller sample is truly and adequately reflective of the state's youth (including growing subpopulations). Tests of similarities and representation on the 2003 sample provided evidence that the original sampling method with the smaller sample size is appropriate.

The current school selection method uses a convenience sample. Interested schools are included providing they add to the representativeness of the survey sample and appropriately reflect the sociodemographic make-up of the state and across regions.

While neither sampling methods are true random sampling, the previous and current sampling procedures used in this study are relatively comparable to that used in the National High School Survey (Monitoring the Future study) (Johnston, O'Malley and Bachman, 2002). The survey sample's massive size (more than 130,000 participants) and representativeness make it a valuable and reliable sample of the population.

Youth Surveys	435 schools in
	140 separate community or school corporation surveys

Total Population Present on Day of Survey	149,038
No grade reported	3,198
Unusable Surveys/Refused to Participate	4,065
Surveys Rejected Due to Error Checking	4,993
Total Number of Usable Surveys	136,782

8th grade	27,025	12th grade 13,9°	78									

Gender Distribution												
Male	66,478	48.6%										
Female	69,335	50.7%										
No response	949	0.7%										

The anonymous written questionnaire was selected for reasons of data quality, cost and time efficiency and effectiveness, as well as prior experience. Self-administered written questionnaires "were found to produce more complete reporting of drug use... [particularly] for reporting of more recent use of 'harder' drugs" (Schober, Fe Casa, Pergamit & Branden, 1992). This method is comparatively less expensive than other data collection methods and is feasible with school-aged youth, given the relatively easy access to this population through administration in school settings. With Indiana's relatively strict enforcement of mandatory school attendance laws, more than 98% of the youth population under age 16 may effectively be reached through school-administered surveys. School drop-out is a significant problem after age 16, and these data reflect only **those students still in school**. Johnston, *et al.*, (1993) describe a protocol that can be used to estimate the total prevalence (including the drop-out population) from data such as these.

#### **DEFINITIONS**

**Prevalence:** the rate of "total cases" of a health issue. Prevalence rates of drug use are traditionally reported as percentages of all drug use over a particular time frame in the entire population at risk. This survey uses several different measures of prevalence.

**Lifetime prevalence:** the percentage of respondents in an entire grade or age group that reports using a particular drug at least once in their lifetime.

**Annual prevalence:** the percentage of respondents in an entire grade or age group that reports using a particular drug at least once during the year prior to the administration of the survey.

**Current Use or Monthly prevalence:** the percentage of respondents in an entire grade or age group that reports using a particular drug at least once in the 30 days prior to the administration of the survey.

**Binge drinking:** the percentage of respondents in an entire grade or age group that reports drinking at least five alcoholic drinks at a sitting (approximately the amount needed to raise a person's blood alcohol level to about 0.08%) in the 2 weeks prior to administration of the survey.

**Daily prevalence:** the percentage of respondents in an entire grade or age group that reports using a particular drug an average of once per day during the 30 day period prior to the administration of the survey. [This rate is inferred from the frequency response to a question about monthly prevalence, which is the same technique used in the two national surveys used for comparison purposes.]

#### PURPOSE AND RATIONALE

This survey was funded by the Indiana Family and Social Services Administration, Division of Mental Health and Addiction, in order to provide a means of meeting the needs of both state and local alcohol and other drug prevention and treatment professionals for information regarding the prevalence of alcohol, tobacco, and other drug use among the youth population of Indiana. There are several needs of both community and state that are met by this survey. For example, this survey allows Indiana to meet federally mandated guidelines for the allocation and expenditures of funds for drug abuse programs. The most efficient allocation of resources requires accurate information about the extent of alcohol and other drug use.

An accurate assessment of local needs is also a major step in designing and implementing alcohol, tobacco and other drug programs for individual communities. This survey allows local professionals to assess the need for programs, and to meet the requirements of funding agencies for an accurate assessment of the extent of the local need. An accurate and comprehensive cross-sectional survey of the prevalence of alcohol, tobacco and other drug use had not recently been conducted in Indiana, prior to the IPRC's 1991 survey. The studies that had been conducted were largely independent, localized efforts that yielded specific information about individual communities. Some of these studies were not conducted by qualified survey researchers, nor were the instruments tested for validity and reliability. Other studies were conducted by private organizations, often at great expense to the community.

This survey began a useful statewide database of information about the prevalence of alcohol, tobacco, and other drug use in Indiana. The individual surveys conducted as a part of this survey provide local communities with specific information needed by them to assess local needs. Since all of the local surveys were conducted using the same protocol and same instrument, and because these protocols and instruments yield data that is directly comparable to two major national surveys, valid comparisons can be made and reasoned inferences can be drawn from those comparisons.

#### **METHODOLOGY**

The survey instrument is a four-page self-contained questionnaire developed by the Indiana Prevention Resource Center in 1991. Items are based upon the questionnaires developed for the National Household Survey on Drug Abuse (NIDA, 1991) and for the National Institute on Drug Abuse's "Monitoring the Future" National High School Survey (Johnston, *et al.*, 1991, 1992, & 1993), and all of the drug use-related items on the questionnaire are directly comparable to items on the national surveys. Items were selected for their value in providing statewide planning data and for comparability with national data. Items were originally constructed to yield data to measure progress toward meeting the national health objectives set out in *Healthy People 2000*.

All of the items were closed-ended questions, including three demographic questions, a ten-digit school code that provides geographic information, and a series of Likert-type items, arranged in subscales, to measure:

- the prevalence of cigarette smoking,
- the prevalence of alcohol, smokeless tobacco, and other drug use,
- adverse consequences due to alcohol and other drug use experienced by the respondent students,
- perceived risks of using alcohol and other drugs, and
- perceived peer approval/disapproval of the student's alcohol and other drug use.

In 1995, additional subscales were added to measure:

- perceived alcohol and other drug treatment needs for children and adolescents in Indiana,
- safety concerns, violence, and weapons use, and
- participation in structured and unstructured recreational and informal educational activities.

In 1998, the following modifications were made:

- questions on cigar smoking, pipe smoking, non-medical use of Ritalin, and use of methcathinone were added to all of the prevalence subscales,
- the subscales on school violence were altered slightly to conform with new U.S. Department of Education data collection guidelines,
- the subscale on recreational and informal educational activities was revised substantially.

In 2002, the following modifications were made:

• questions on lysergic acid diethylamide (LSD), methylenedioxy methamphetamine (MDMA, ecstasy), flunitrazepam (Rohypnol, roofies), and gamma hydroxy butyric acid (GHB) were added to all of the prevalence subscales.

• questions assessing psychedelic prevalence were modified to be more specific (i.e., LSD Only, and Other Psychedelics).

In 2005, a subscale was added to measure:

- questions on methamphetamine prevalence and age of first use were added.
- questions on methcathinone prevalence and age of first use were dropped.
- Questions on gambling prevalence, including card playing, placing bets, lottery ticket purchasing, and gambling in casinos.
- questions on feelings and compulsion related to gambling.

This report describes the responses to the alcohol, tobacco, and other drug use prevalence questions. It also includes the responses to the new gambling subscale. Additional monographs in this series will report on the treatment needs; safety, violence, and weapons use; and participation in youth activities questions.

The questionnaire was designed to offer consistency of measurements over time, provide statistics that were comparable to nationally-conducted drug use surveys, and for ease of use and simplicity. Therefore, the results can be plainly presented in an easily understood format, and the results from Indiana can be compared with those from national surveys. The questionnaire is intended for use over several samplings. There are several benefits to this strategy:

**First**, it provides for the construction of a large database. The larger a database, the more inherently accurate and valid the collected data will be.

**Second**, the more accurate the Indiana data are, the more accurate the comparisons between Indiana data and other national data become (as the national surveys have collected data from tens of thousands of subjects).

**Third**, since the data are comparable both through the structure of the questionnaire and the times the questionnaires are administered, any changes will more accurately reflect actual changes in the use of the drugs examined. These changes can reflect upon various prevention strategies, through pre- and post-testing. For example, if the survey were administered at a school before that school begins a new prevention program and then surveyed again after the program has been implemented, then subsequent changes in the results of the two surveys can better be attributed to that program.

During development of the survey, the basic questionnaire was reviewed by a panel of experts for content validity, subjected to 6 months of pilot testing and reviewed by focus groups of school-aged youth, and tested for reliability using the test-retest method (correlation coefficient 0.82). A SMOG Index of Readability was calculated to assure readability at the 5th grade level. The survey form is optically scannable, allowing for direct transfer of data from the forms to a computer file, utilizing an NCS Op-Scan 8 reader. The collected data are analyzed using descriptive statistical techniques, chi-squares and multiple regression through SPSS-PC routines operating in a WindowsXP environment on a high end Pentium IV platform, or in a HP-UX environment on large DEC-Alpha mainframes.

The questionnaire used in this survey was designed by the Indiana Prevention Resource Center for use in school settings. All of the questions are comparable to both the National High School Survey (conducted by the University of Michigan) and the National Household Survey

(conducted by the National Institute on Drug Abuse), which show drug use rates for high school 8th, 10th and 12th graders, and for persons aged 12 and over, respectively.

The basic portion of each questionnaire is divided into 27 questions, of which 13 are multi-part questions. [See Appendix for copy of the questionnaire.] For the original instrument, items were selected to gather data comparable to the *Healthy People 2000* standards utilized by the U.S. Public Health Service, with the intention of producing data that could be used to assess the state's and a community's success at meeting the *Healthy People 2000* target goals. *Healthy People 2010* serves as the current planning document. Since these goals often are the basis for evaluation specified in federal and state grant funding announcements, the data will assist Indiana applicants in securing such funding.

As in the previous fourteen surveys conducted by the Indiana Prevention Resource Center, all surveys were conducted during a six week period in the Spring so that the high school data would be comparable to the National High School Survey data. Further surveys will be conducted during the same time period each year, in order to yield consistently valid and reliable results. Due to the relatively high rates of new drug experimentation during a particular school year, it is necessary to survey all populations at about the same time, to avoid "maturation bias." For example, results of a survey conducted in one population in September would not be comparable to results of a survey conducted in another population in April because many more students may have tried drugs for the first time during the intervening seven months.

Students complete the questionnaire in private, and anonymously deposit it in a collection box or envelope to protect confidentiality. No identifying data are collected, except gender, grade in school, and ethnic background, and data are processed by a statistical team that has no direct access to the students, to assure anonymity. Students are given the option of declining to participate, or of turning in a blank survey instrument. More than 92% of eligible students complete usable surveys at every site. At each school, data collection is supervised by the classroom teachers or a classroom monitor provided by the local school. A 12-minute training videotape and written instructions are provided to all data collectors, to assure consistent collection of data. Each school has a school coordinator who is personally trained by the IPRC, and who coordinates and trouble-shoots data collection at the schools. IPRC survey staff are available via a toll-free (800) number telephone on all data collection days, in the event of questions or problems.

As a check on self reporting accuracy, students are asked how truthfully they had answered the questions. In 2005, approximately 81.7% answered that they were completely truthful in responding to the survey, 6.7% indicated that they were mostly truthful with their responses, and 1.6% responded that they were not truthful at all. Focus groups of students during the 1991 pilot test stage reported using the "mostly truthfully" option when they intended to answer all items truthfully but were uncertain about the answer to a small number of items, such as the inability to recall exact dates or numbers of drug use episodes. An error checking protocol was used to eliminate a small number of surveys that fell into three categories: (1) those in which the student replied that he/she had responded "not truthfully at all," (2) those with more than two inconsistent responses that suggested a random pattern of answers (i.e., students who report "never used" a particular drug in their lifetime, but then report use of that same drug in the past year or past month), and (3) pharmacologic implausibility (i.e., students who report such excessive use of multiple drugs as to create a cumulative effect that would be lethal). These precautions eliminated surveys that were not completed seriously by the respondents. The

protocols are consistent with recommended protocols to improve validity of self-reports of drug use recommended by an advisory panel on validity issues convened by the National Institute on Drug Abuse (Rouse, Kozel & Richards, 1985).

To substantiate the consistency of the self reports on the current survey, in 1992 a correlation coefficient of the reported use of various drugs on a five-point Likert scale was calculated comparing reported levels of use in the past year with use in the past month. The correlation coefficient was calculated at +0.83, which was statistically significant at p<.01. Given the changes to the instrument (e.g., inclusion of new drugs), another test of consistency was warranted. Therefore, in 2004, a correlation coefficient was calculated on the reported use of **all** surveyed drugs using the monthly and annual prevalence data. The revisions to the instrument helped to further improve its already impressive reliability; the new correlation coefficient was found to be +.86 (p < .01).

The perceived risk component consisted of a seven-item belief subscale related to perceived risk of physical or other harm from drug use. The items were placed on a four point Likert format ranging from "no risk" to "great risk." This subscale was found to be internally consistent with an alpha reliability coefficient of 0.85. Reported frequency of episodes of adverse consequences of the use of alcohol and other drugs was measured on a ten-item Likert-type scale asking students to report the frequency of use-related events such as hangovers, missed school, or poor performance on a test. This subscale also was found to be internally consistent with an alpha reliability coefficient of 0.90. The subscale on perceived peer approval/disapproval consisted of seven items with approve/disapprove alternatives. The items in this subscale were internally consistent with an alpha reliability coefficient of 0.82.

The instrument was designed to produce data that are comparable with that produced by two national surveys: the "National High School Survey" and the "National Household Survey."

The "National High School Survey," also known as the *Monitoring the Future Survey*, has been administered every year since 1975 to between 15,000 and 18,000 graduating high school seniors from approximately 150 high schools nationwide. Beginning with 1991, this survey also gathered limited data from 8th and 10th grade students in the same school corporations. It is administered through the University of Michigan's Institute for Social Research on behalf of the National Institute on Drug Abuse. The results used in this report's comparisons are those from approximately 45,000 8th, 10th, and 12th grade students in more than 400 schools nationwide.

#### **Limitations and Possible Sources of Error**

As in all surveys, the possibility of errors and the limitations of the survey, its instrument, and the manner in which it is distributed must be taken into account when interpreting a survey's results. The following limitations are possible sources of such errors in regard to this survey:

**Nonsampling errors:** those errors which are the result(s) of recording mistakes (respondents marking the wrong answer, i.e., doesn't actually apply to them), coding errors (the machine skips or misreads a response), missing data (some respondents don't answer all the questions), and differences in respondents' interpretations of the questions and answers. These were minimized for this survey by a pre-testing conducted at Indiana University, specialized training of people who administered the survey, coding checks when completed questionnaires were scanned, and

checks of quality control. Where the survey team suspects nonsampling errors, these have been noted in this report.

**Sampling errors:** those errors that occur from the way in which the respondents are chosen and populations are targeted. In other words, the reported current use of a particular drug may vary slightly from one sample to the next, because of the natural differences which exist in people, their location, social practices, etc., and the manner in which they came to participate in the survey. For example, people in the far southern end of the state may have slightly different use rates of particular drugs than people in the extreme northwest corner of the state, and the statewide results may not reflect an accurate picture of the drug use rates throughout the state if disproportionate numbers of people are sampled in the south relative to the northwest portion of the state.

Scientists use statistical formulas to calculate an estimate of the amount of sampling error. Hundreds of such estimates would have to be made for this report, based upon the exact number of responses in each cell category. To avoid unnecessary difficulty in reading such reports, it is customary to report the **average** estimate of sampling error, recognizing that the error may be larger in cells with very small numbers of respondents.

For the youth populations, the average estimate of sampling error for this the whole population and for each grade 6 through 12 in this report is less than  $\pm 1\%$ , within a 95% confidence level. This means that we estimate that if the same number of respondents were sampled 100 times, using the same techniques, that in 95 or more of the 100 times, the percentages reported would be within or 1% of the percentages reported here.

As reported above, calculation for each response in the report would render the report difficult to read. However, for the convenience of the reader the addition of margins of error (which were calculated for the ATOD prevalence statistics by grade) were calculated. These are included within the historical tables.

In addition, the following should be taken into consideration when attempting to interpret the results presented in this report:

- self-reporting depends on accuracy of memory and honesty in answering questions.
- the sample from the National Household Survey was relatively small (about 4,000) compared to the Indiana sample of more than 136,000 for the same age group.
- those people surveyed were the ones who attended school on the day on which the survey was conducted at their location. It does not (nor does the National High School Survey) sample absentees or school dropouts, nor was it a compulsory survey. Participation in all three surveys was strictly voluntary.
- the National Household Survey uses a "household interview" technique that relies upon oral responses to questions posed by an interviewer. This technique may produce results that are not directly comparable to the "anonymous written questionnaire" techniques utilized by the IPRC survey and by the National High School Senior Survey.

#### NOTES:

This report contains the *Main Findings* of this survey (the gross prevalence rates). Over time, additional reports will be issued using the data collected in this survey. These specialized reports, and/or articles, will provide more detailed analysis of certain findings.

### ATOD SURVEY 2005

## Guide to Viewing and Interpreting Charts and Graphs

#### The Bar Charts are graphic illustrations of different prevalence rates.

- One chart for each grade is included in this section.
- The Y axes (i.e., vertical scale) for all bar charts are set to 100 percent, so that comparisons can be readily made across grades.

#### The Line Graphs are graphic illustrations of ATOD-use trends.

- Each chart depicts trends for all grades at a glance, with each grade represented by distinct hash marks.
- The Y axis (i.e., vertical scale) for each line graph varies. The scale for each graph is set to maximize the clarity of the trends.

### Indiana Prevention Resource Center

### ALCOHOL, TOBACCO AND OTHER DRUG USE SURVEY

© COPYRIGHT 2005, 2002, 2001, 1995, 1993, 1991 The Trustees of Indiana University. All rights reserved.

Questions # 24 - 26 used with permission from the Minnesota Department of Education.

This survey is funded, in part, by a contract with the Indiana Family and Social Services Administration, Division of Mental Health and Addiction, HHS / SAMHSA, CSAP, SAPT Block Grant.

#### PRIVACY STATEMENT

This survey is completely confidential. Complete the survey in private and deposit your completed survey in the privacy envelope, as instructed by your teacher or supervisor. Do not place your name or any identifying marks on the survey form or envelope. There is no way for anyone to identify your individual responses. The survey envelopes will not be opened until they are received at the statewide processing center.

#### YOUR PARTICIPATION IS VOLUNTARY

Your participation in this survey is voluntary. If you do not wish to answer a question, just leave it blank. If you do not wish to participate in this survey, you may:

- · Return the entire survey form blank
- Answer questions with random answers and then answer "not truthfully at all" to the last question. Your form will be discarded and no one will know that you did not participate.
- Inform the teacher or supervisor that you choose not to participate in the survey.

You will not be penalized in any way for deciding not to participate in this survey. We do value your participation, however. Accurate results are dependent upon getting as many students as possible to volunteer to participate in this confidential survey. The results are used by many state and federal agencies to help determine how much money will be given to youth programs and to evaluate the effectiveness of drug programs in your community. Your help is important to this effort.

Thank you for your assistance.
